"The authors have done a superb job of distilling a vast amount of information on the biology of the terrestrial mammals of the eastern United States in a style that will not only satisfy the expert's need for accurate data but will also appeal to students and others interested in natural history." —James N. Layne, Archbold Biological Station In their definitive work on eastern mammals, John O. Whitaker, Jr., and W. J. Hamilton, Jr., vividly convey their sheer delight at the variety and abundance of mammalian life. They have brought together a wealth of biological information and applied a biological subspecies concept to the mammals of the eastern United States. Their research extends "from the high reaches of Mount Katahdin in northern Maine, where water shrews and moose hold company," to the unglaciated hills of southern Indiana, where pygmy shrews (each weighing less than a dime) lived undetected until 1981. From there, they reach to "the cypress swamps of lower Florida, where the spoor of the mountain lion may be seen." \*Describes the animals, their behavior, and dispersion in all 27 states east of the Mississippi River. \*Almost entirely rewritten, this edition provides an abundance of scientific information in combination with anecdotes, field notes, and an underlying reverence for the fragile diversity of animal life. \*Illustrations include 110 range maps, 167 black-and-white photographs, and 92 color images. \*Covers 121 species, 17 more than in the previous edition. \*Uses a biological subspecies concept, showing the results of evolution through differentiation. \*Provides keys to orders and genera, anatomical line drawings. \*Summarizes information on endangered and threatened species for each of the eastern states. \*Lists state mammal books in the literature section. Cinnabar, a clever fox, comes out of his home every day at one o'clock to tease the fox hunters nearby and let them chase him until nightfall. An introduction to the red fox, including tips on tracks, signs, and where to look for them. Beautiful seductive and extremely dangerous Franca Tantardini is one of Italy's most ruthless political extremists. When she is captured in a shoot-out her fanatical young lover Giancarlo Battestini vows to set her free and with quiet watchfulness waits for the moment to strike. In Rome a British businessman Geoffery Harrison has been taken hostage by a ruthless organised crime syndicate - kidnap is after all a growth industry. The British Government are adamant that they will not pay the two-million-dollar ransom and discharge responsibility to the Italian police. As political wrangling takes hold Battestini sees a weakness and realises that the only way to secure the release of his beloved Franca is to capture Harrison and bargain his life for hers. The authorities are confronted with a terrible choice. Should they release a woman who has masterminded the murder of so many or let an innocent man die? In this engaging introduction to the red fox (*Vulpes vulpes*), J. David Henry recounts his years of field research on this flame-colored predator. With its catlike whiskers, teeth, and paws, as well as vertical-slit pupils, the North American red fox not only resembles but often behaves like a feline, especially when hunting. Probing the reasons for these similarities, Henry reveals the behavior and ecology of a species that thrives from the edge of suburbia to the cold northern tundra. Around a campfire in the woods through long hours of night, men used to gather to listen to the music of hounds' voices as they chased an elusive and seemingly preternatural fox. To the highly trained ears of these backwoods hunters, the hounds told the story of the pursuit like operatic voices chanting a great epic. Although the hunt almost always ended in the escape of the fox—as the hunters hoped it would—the thrill of the chase made the men feel "that they [were] close to something lost and never to be found, just as one can feel something in a great poem or a dream." *Gray Ghosts and Red Rangers* offers a colorful account of this vanishing American folkway—back-country fox hunting known as "hilltopping," "moonlighting," "fox racing," or "one-gallus fox hunting." Practiced neither for blood sport nor to put food on the table, hilltopping was worlds removed from elite fox hunting where red- and black-coated horsemen thundered across green fields in daylight. Hilltopping was a nocturnal, even mystical pursuit, uniting men across social and racial lines as they gathered to listen to dogs chasing foxes over miles of ground until the sun rose. Engaged in by thousands of rural and small-town Americans from the 1860s to the 1980s, hilltopping encouraged a quasi-spiritual identification of man with animal that bound its devotees into a "brotherhood of blood and cause" and made them seem almost crazy to outsiders. This book offers an all-encompassing resource for reliable information on the medical management of wild birds, mammals, amphibians, and turtles. Focusing on the medical information relevant to the wildlife setting, it covers triage, emergency care, and other key considerations in handling, diagnosing, and treating wild animals. The book's population-based approach encourages practitioners to understand individual animal care within the broader context. *Medical Management of Wildlife Species: A Guide for Practitioners* begins with a brief summary of natural history, and introductory chapters address general topics such as pre-release conditioning, post-release monitoring, and legal issues associated with handling wildlife species. Species-specific chapters provide practical information on medical management, including the most prevalent concerns for each species and the epidemiology of infectious diseases. Provides a complete reference to handling, diagnosing, and treating wild species Covers the full range of North American wildlife Includes concepts that can be applied to species globally Emphasizes information relevant to the wildlife setting Focuses on individual medicine, firmly grounded within population medicine for a broader approach Targeted at wildlife veterinarians, veterinary clinicians that will be presented with wildlife, veterinary technicians, and wildlife rehabilitators *Medical Management of Wildlife Species* is a must-have addition to the bookshelf of wildlife veterinarians and any veterinarian seeing occasional wild animals, as well as wildlife biologists and researchers. A red fox stands poised at the edge of a woodchuck den, his ears perked for danger as two pudgy fox cubs frolic nearby. A mother black bear and her cubs hibernate beneath a felled tree. A barred owl snags a hapless cottontail from a meadow with its precise talons. In *The Quarry Fox and Other Tales of the Wild Catskills*, Leslie T. Sharpe trains her keen eye and narrative gifts on these and other New York wildlife through her tales of close observations as a naturalist living in the Great Western Catskills. *The Quarry Fox* is the first in-depth study of Catskill wildlife since John Burroughs invented the genre of nature-writing, in which Sharpe weaves her experiences with the seasons, plants, and creatures with the natural history of each organism, revealing their sensitivity to and resilience against the splendor and cruelty of Nature. Sharpe's frank, scientific observations join with her deeply felt connection to these creatures to instill in readers an appreciation of the undaunted and variegated beauty of the Catskills and camaraderie with its animals. From contemplating the importance of milkweed for monarchs to lay their eggs to reveling in the first steps of a wobbly fawn, *The Quarry Fox* is a celebration of the natural world and our place in it. Research on chemical communication in animals is in a very active and exciting phase; more species are studied, data are accumulating, concepts are changing, and practical application seems feasible. While most of the work on chemical ecology and chemical signals deals with insects, vertebrate communication provides a formidable challenge and progress has been slow. Joint efforts and frequent direct contacts of ecologists, behaviorists, psychologists, physiologists, histologists and chemists are required. Such an interdisciplinary exchange of information took place on the occasion of the Symposium on Chemical Signals in Vertebrates and Aquatic Animals in Syracuse, New York, from May 31 to June 2, 1979. More than one hundred investigators from seven countries participated, and the papers presented comprise this volume. Since the first Symposium on Vertebrate Chemical Signals at Saratoga Springs in 1976, considerable progress has been made with field studies, the physiology of the vomeronasal organ, and its role in reproductive behavior. The behavioral functions and chemical nature of priming pheromones are better understood. Efforts to isolate and identify mammalian pheromones are gaining ground, and the bioassays are becoming

more sophisticated. In addition to formal presentations, one evening of the Symposium was devoted to round-table discussions of particular topics. The selected themes indicate the "growing points" of chemical communication research: priming pheromones, vomeronasal organ, bioassay, and practical applications. \* Instant NEW YORK TIMES and USA TODAY bestseller \* \* GOODREADS CHOICE AWARD WINNER for BEST DEBUT and BEST ROMANCE of 2019 \* \* BEST BOOK OF THE YEAR\* for VOGUE, NPR, VANITY FAIR, and more! \* What happens when America's First Son falls in love with the Prince of Wales? When his mother became President, Alex Claremont-Diaz was promptly cast as the American equivalent of a young royal. Handsome, charismatic, genius—his image is pure millennial-marketing gold for the White House. There's only one problem: Alex has a beef with the actual prince, Henry, across the pond. And when the tabloids get hold of a photo involving an Alex-Henry altercation, U.S./British relations take a turn for the worse. Heads of family, state, and other handlers devise a plan for damage control: staging a truce between the two rivals. What at first begins as a fake, Instagramable friendship grows deeper, and more dangerous, than either Alex or Henry could have imagined. Soon Alex finds himself hurtling into a secret romance with a surprisingly unstuffy Henry that could derail the campaign and upend two nations and begs the question: Can love save the world after all? Where do we find the courage, and the power, to be the people we are meant to be? And how can we learn to let our true colors shine through? Casey McQuiston's *Red, White & Royal Blue* proves: true love isn't always diplomatic. "I took this with me wherever I went and stole every second I had to read! Absorbing, hilarious, tender, sexy—this book had everything I crave. It is romantic, sexy, witty, and thrilling. I loved every second." - Taylor Jenkins Reid, New York Times bestselling author of *Daisy Jones & The Six*

*Blood Narrative* is a comparative literary and cultural study of post-World War II literary and activist texts by New Zealand Maori and American Indians—groups who share much in their responses to European settler colonialism. Chadwick Allen reveals the complex narrative tactics employed by writers and activists in these societies that enabled them to realize unprecedented practical power in making both their voices and their own sense of indigeneity heard. Allen shows how both Maori and Native Americans resisted the assimilationist tide rising out of World War II and how, in the 1960s and 1970s, they each experienced a renaissance of political and cultural activism and literary production that culminated in the formation of the first general assembly of the World Council of Indigenous Peoples. He focuses his comparison on two fronts: first, the blood/land/memory complex that refers to these groups' struggles to define indigeneity and to be freed from the definitions of authenticity imposed by dominant settler cultures. Allen's second focus is on the discourse of treaties between American Indians and the U.S. government and between Maori and Great Britain, which he contends offers strong legal and moral bases from which these indigenous minorities can argue land and resource rights as well as cultural and identity politics. With its implicit critique of multiculturalism and of postcolonial studies that have tended to neglect the colonized status of indigenous First World minorities, *Blood Narrative* will appeal to students and scholars of literature, American and European history, multiculturalism, postcolonialism, and comparative cultural studies. In this engaging introduction to the red fox (*Vulpes vulpes*), J. David Henry recounts his years of field research on this flame-colored predator. With its catlike whiskers, teeth, and paws, as well as vertical-slit pupils, the North American red fox not only resembles but often behaves like a feline, especially when hunting. Probing the reasons for these similarities, Henry reveals the behavior and ecology of a species that thrives from the edge of suburbia to the cold northern tundra. Well-controlled, manipulative experiments on mammals free-ranging in their natural environment have seldom been carried out, even though the ultimate reference point of ethology is the behavior of the animal in its natural environment. Where large mammals are concerned, so few manipulative field experiments have been done that we may question if this reference point to ethology is not beyond the reach of the experimental techniques of the science. We may ask whether the behavior of large mammals in a natural environment can indeed be studied by experimentation. The following study explores this question by experimentally investigating the scent marking behavior of free-ranging red foxes. Using a specially made, inexpensive and rugged heat-detecting camera, you can view wildlife up close. *Camera Trapping Guide* gives you the trapping techniques and knowledge of animal behaviors so you can get the best possible photos and videos. Includes 37 species common to the eastern U.S. Large and small mammals, squirrels to bears, deer, and moose, plus birds and even the American alligator—are covered. With photos and range maps each entry gives details on physical characteristics, tracks and sign, diet, habitat, and breeding. Also included are specific camera trapping techniques pertinent to each animal. You'll learn the characteristics of the various cameras, where to place the camera and the camera settings to get best results, and how to minimize impacts on the environment. This book is the first to fully explore the fox as the object of both derision and fascination, from the forests of North America to the deserts of Africa to the Arctic tundra. *Natural Neighbours: Selected Mammals of Saskatchewan* focuses on various mammals found in Saskatchewan and describes their appearance, habits, food, habitat, survival strategies, ecological relationships, status, and range. Today's hunting debate began in the eighteenth century, when the idea of the countryside was being invented through the imaginative displacement of agricultural production in favour of country sports and landscape tourism. Between the Game Act of 1671 and its repeal in 1831, writers on walking and hunting often held opposed views, but contributed equally to the origins of modern ecology, while sharing a commitment to trespass that preserved common rights in an era of growing privatization. This gorgeous and lyrical picture book follows a year in the life of a red fox named Vixen. Kids will learn about a common backyard neighbor as they read how Vixen finds food, hunts, escapes threats, finds a mate, and raises her kits—all the way to the day that she and her mate watch their kits head off to lead their own secret lives. Stunning, realistic illustrations celebrate the beauty of these mysterious creatures as readers learn important facts through an engaging and fascinating story. The book also includes back matter with more in-depth information, a glossary, and further resources. There were numerous tribes scattered all across the United States long before they were discovered by foreigners The white man. The period of the Indians was long when they lived within the confinement of the lands they called home. These lands that they cherished, their beliefs they cherished. They were one with the almighty one and free for hundreds of years but in a blink of an eye, they lost it all. They were hunted and annihilated ridiculed and persecuted. They were a race indifferent to us but they were a race the foreigners on their lands didn't want and by what ever means possible they meant to disperse these people from their homes and take from them everything they owned and they did just that. When Christopher Columbus born 1451 the son of Domenico Columbus stepped ashore on American soil on the 12th October 1492 everything changed for the Indians. By the time De Sota and Ponce De Leon arrived searching for gold and slaves many an Indian had died at their hands. At this time there were supposedly some 10 million Indians inhabiting the land but after three centuries this number was reduced by 90%. The English arrived then the French and the Dutch every Sovereign wanted a piece of the land to claim as their own and the Indians succumbed to diseases imported by the whites. Famine and warfare were directed at them as the white people pushed them further and further away from their own lands so they could claim and prosper by them. Before 1600 there were about one million Indians who lived north of the Rio Grande speaking some 2,000 languages but most of these languages are dead now. These people lived mainly of the land growing maize, fishing and hunting to feed their people. When the Europeans arrived that all changed and destruction quickly followed as these intruders wanting what the Indians had and what was on their lands. In New England the tribes were hit by diseases brought by the white men which wiped out thousands. The Indian people were cheated by the Quakers, disgraced by the Iroquois and defeated by the Dutch in the Esopus wars of 1660. They never stood a chance against these people and hundred's of years later they still didn't stand a chance. By 1840 all the Eastern tribes, those that had survived annihilation were forcibly removed to Indian territory west of the Mississippi. There are no words which could compensate for the suffering over the years of these people, the Native Americans, the Indians. These people who were pushed and shoved all over the United States, starved and murdered, beaten and humiliated but they are growing stronger. They are reclaiming their heritage and people are listening. To many lies were told, to many treaties broken. Many of the tribes who lived in the United States before their exodus to Indian Lands or their extinction can be found at the back of this book. This list may not fully represent all the tribes which inhabited the land over the period. There are many long forgotten names of tribes who were completely obliterated over the years when peace was hard to come by. The tribes listed though do represent a vast majority of the Indians living in the United States during the period before the white man caused some of them to be extinct. There were many tales of greed throughout the period. Many of the tribes included in this book suffered harshly at the hands of soldiers. The same soldiers the Government had sent to protect them, when in fact, all they did was abuse them for their own ends and for greed and in some cases glory. The subject of the Native American Indian has always been a touchy one. At times they have been overlooked. At times they have been portrayed as the "savages", We have found out over the years that this was not so in many cases. A large injustice was dealt to these people. The real history of these people like many other events has been swept under the American carpet so it is easier to forget whose lands you now live on. Whose blood lies dried in the earth. Whose bones are scattered, some not in peace as even in death some archeologist is looking for artifact's, they do not care if the ground is sacred or not. The Indians paid their price to live upon this earth, let their spirits go free. Hard to believe, not really considering the record of the white settlers and the forcible removal of the Indians from their lands especially when Gold was found. Eyes lit up, greed set in and murder began. Yes their story has been written before and it probably will be again for there is a

never ending quest for truth and justice for these people, the real first Americans who we seem to overlook at times, for they are the indigenous people. “Outstanding. This is a brilliant work by the best in the field. Watching a great tracker at work can feel like watching a magician, but this book demystifies the process and inspires the reader to begin to look closer and open the world of tracking.”—John Muir Laws, author of *The Laws Guide to the Sierra Nevada*

Table of contents You are about to open the pages of a book containing some of the make believe friends of Larry M. Thompson called Poppy’s Lil Friends Friends that reach out to you and ask to be heard and to be believed in. To make them really stand out and get your attention I have given them the ability to talk. I’m allowing them to use improper words to make it sound like little animals talking. We know animals can’t talk like us. Well, in poppy’s World they can talk. Read it and see for yourself. Larry M. Thompson No group of wild mammals so universally captures the emotions of people world-wide than do wild canids. That emotion can be enchantment and fascination, but it can also be loathing, because the opportunism that is the hallmark of the dog family also leads them into conflict with humans. In the developed world at least, the fascination with wild canids doubtless stems from people's captivation with domestic dogs - everybody feels they are an expert on canids! While most people may be familiar with only the better known members of the dog family, such as the grey wolf and the red fox, there are in fact 36 species of wolves, dogs, jackals and foxes. They attract hugely disproportionate interest from academics, conservationists, veterinarians, wildlife managers and the general public. This book brings together in single volume an astonishing synthesis of research done in the last twenty years and is the first truly compendious synthesis on wild canids. Beginning with a complete account of all 36 canid species, there follow six review chapters that emphasise topics most relevant to canid conservation science, including evolution and systematics, behavioural ecology, population genetics, diseases, conflict/control of troublesome species, and conservation tools. Fifteen detailed case studies then delve deeply into the very best species investigations currently available written by all the leading figures in the field. Much of the material is previously unpublished and will make fascinating reading far beyond the confines of canid specialists. These chapters portray the unique attributes of wild canids, their fascinating (and conflictive) relationship with man, and suggestions for future research and conservation measures for the Canidae. While most canid species are widespread and thrive in human dominated landscapes, several are in severe jeopardy; habitat loss, illegal hunting, persecution by farmers and disease all imperil dwindling populations. A final chapter analyses the requirements of, and approaches to, practical conservation, with lessons that go far beyond the dog family. It concentrates particular attention on priorities for the protection of the most threatened canid species, including the red wolf, African wild dog, Ethiopian wolf, Island fox and Darwin's fox. The wild canids provide examples that will thrill the evolutionary biologists and theoretician, enthral the natural historian and challenge the conservationist and wildlife manager. Anybody interested in evolutionary and behavioural biology, in mammals, in the environment, or in conservation will find much that is new and enriching in this book.

Henry the cockerel is afraid of everything until his friend Buffy comes up with a plan to make him look good in front of the other hens. Fox World, based on true events, takes the reader under the canopy of an urban forest on the outskirts of Washington, D.C. for a year-long walk with a weary sales executive and his muse, a wild red fox. Aged, ill and injured, both fox and man seek healing in their journey, not only for themselves, but for the ecologically stressed forest which is under siege. They are joined on their five-hundred-mile walkabout by the fox’s forest friends – owl, buck deer, hawk, blue heron, and raccoon, and each animal’s story illustrates why this small forest is so soothing and majestic in its allure. Starting in brutally cold winter, followed by the wettest summer on record, fox and man face daunting life challenges on their walks, from heart arrhythmia which ends the executive’s career to a coyote attack and critical illnesses faced by the elderly fox. And through these traumatic events, the two bond for survival, and the fox’s wild perspective teaches his human friend unforgettable lessons about healing, coping, serenity, wonderment, mindfulness, and simple treasures (e.g., the sun setting atop the great oaks, an owl serenade under moon beams, a shared cup of bison bone broth on an icy day). Drawn in by the plight of the fox’s forest as destruction looms, the man decides to take a stand and help the fox and his animal friends. Richly graced with gorgeous nature photos and infused with insights that can only be imparted by those who have come to genuinely appreciate life, Fox World is an exhilarating walk in the woods that you’ll never forget. This pocket-sized field guide to native Indiana mammals offers color photos, skull close-ups, and range maps, along with descriptions and clues to finding and identifying all mammals indigenous to the area -- and even a few that are not, but can now be found in the state. In addition to detailing Indiana's wild, mostly small, secretive, and nocturnal mammals, John O. Whitaker, Jr., describes the region's habitats, climate, and vegetation. *Mammals of Indiana: A Field Guide* precisely identifies the creatures you are likely to encounter while hiking a trail, camping in a state park, or picnicking in your own backyard. Whether you are a biologist, veterinarian, wildlife manager, or simply a nature enthusiast, this guide is certain to be a welcome companion during your next outdoor adventure. ”

*A Biocultural Approach to Literary Theory and Interpretation* offers a fresh and reasoned approach to literary studies that at once preserves the central importance that interpretation plays in the humanities and embraces the exciting developments of the cognitive sciences. Carnivores provide innumerable ecological benefits and play a unique role in preserving and maintaining ecosystem services and function, but at the same time they can create serious problems for human populations. A key question for conservation biologists and wildlife managers is how to manage the world's carnivore populations to conserve this important natural resource while mitigating harmful impacts on humans. In *People and Predators*, leading scientists and researchers offer case studies of human-carnivore conflicts in a variety of landscapes, including rural, urban, and political. The book covers a diverse range of taxa, geographic regions, and conflict scenarios, with each chapter dealing with a specific facet of human-carnivore interactions and offering practical, concrete approaches to resolving the conflict under consideration. Chapters provide background on particular problems and describe how challenges have been met or what research or tools are still needed to resolve the conflicts. *People and Predators* will help readers to better understand issues of carnivore conservation in the 21st century, and provides practical tools for resolving many of the problems that stand between us and a future in which carnivores fulfill their historic ecological roles.
