This volume presents the most recent archaeological, historical, and ethnographic research that challenges simplistic perceptions of Native smoking and explores a wide variety of questions regarding smoking plants and pipe forms from throughout North America and parts of South America. By broadening research questions, utilizing new analytical methods, and applying interdisciplinary interpretative frameworks, this volume offers new insights into a diverse array of perspectives on smoke plants and pipes. The soaring peaks of the greatest mountain range on Earth have long drawn visitors from around the globe, and one of the most famous of the 19th century was British adventurer and scholar Laurence Waddell, who spent most of a decade and a half exploring the nations that cling to the sides of the mighty mountains, learning the ways of their peoples, and sharing his experiences with Western readers. Here, in this 1899 classic of Himalayan travel, Waddell introduces us to the challenges of traveling in the region, takes us on visits to Nepalese and Tibetan tea gardens, journeys to monasteries, palaces, and temples, and much more. Beautiful photos and drawings complement Waddell's exciting and gripping tales-he offers some of the first "evidence" for the mysterious creatures known as "yeti," for instance-and make this an essential work for anyone drawn to the dangerous beauty of the Himalayas. British archaeologist and Orientalist LAURENCE AUSTINE WADDELL (1854-1938) also wrote *The Buddhism of Tibet or Lamaism* (1894) and *Lhasa and Its Mysteries* (1905). The *Travels of Sir John Mandeville* is the chronicle of the alleged Sir John Mandeville, an explorer. His travels were first published in the late 14th century, and influenced many subsequent explorers such as Christopher Columbus. As interest in folklore increases, the folktale acquires greater significance for students and teachers of literature. The material is massive and scattered; thus, few students or teachers have accessibility to other than small segments or singular tales or material they find buried in archives. Stith Thompson has divided his book into four sections which permit both the novice and the teacher to examine oral tradition and its manifestation in folklore. The introductory section discusses the nature and forms of the folktale. A comprehensive second part traces the folktale geographically from Ireland to India, giving culturally diverse examples of the forms presented in the first part. The examples are followed by the analysis of several themes in such tales from North American Indian cultures. The concluding section treats

theories of the folktale, the collection and classification of folk narrative, and then analyzes the living folklore process. This work will appeal to students of the sociology of literature, professors of comparative literature, and general readers interested in folklore. A Chinese Bestiary presents a fascinating pageant of mythical creatures from a unique and enduring cosmography written in ancient China. The *Guideways through Mountains and Seas*, compiled between the fourth and first centuries B.C.E., contains descriptions of hundreds of fantastic denizens of mountains, rivers, islands, and seas, along with minerals, flora, and medicine. The text also represents a wide range of beliefs held by the ancient Chinese. Richard Strassberg brings the *Guideways* to life for modern readers by weaving together translations from the work itself with information from other texts and recent archaeological finds to create a lavishly illustrated guide to the imaginative world of early China. Unlike the bestiaries of the late medieval period in Europe, the *Guideways* was not interpreted allegorically; the strange creatures described in it were regarded as actual entities found throughout the landscape. The work was originally used as a sacred geography, as a guidebook for travelers, and as a book of omens. Today, it is regarded as the richest repository of ancient Chinese mythology and shamanistic wisdom. The *Guideways* may have been illustrated from the start, but the earliest surviving illustrations are woodblock engravings from a rare 1597 edition. Seventy-six of those plates are reproduced here for the first time, and they provide a fine example of the Chinese engraver's art during the late Ming dynasty. This beautiful volume, compiled by a well-known specialist in the field, provides a fascinating window on the thoughts and beliefs of an ancient people, and will delight specialists and general readers alike.

This is the only book available on building network DMZs, which are the cornerstone of any good enterprise security configuration. It covers market-leading products from Microsoft, Cisco, and Check Point. One of the most complicated areas of network technology is designing, planning, implementing, and constantly maintaining a demilitarized zone (DMZ) segment. This book is divided into four logical parts. First the reader will learn the concepts and major design principles of all DMZs. Next the reader will learn how to configure the actual hardware that makes up DMZs for both newly constructed and existing networks. Next, the reader will learn how to securely populate the DMZs with systems and services. The last part of the book deals with troubleshooting, maintaining, testing, and implementing security on the DMZ. The only book published on Network DMZs on the components of securing enterprise networks This is the only book available on building network DMZs, which are the cornerstone of any good enterprise security configuration. In the roaring 1990s, many companies seemed to claim great victories-acquiring another company, obtaining state-of-the art technology, or hiring a potential CEO savior-only to find that they had made a great mistake. The term "Winner's Curse" was coined by economists to explain an effect commonly observed in auctions. In such situations, since the winning bidder is usually the most optimistic about the value of the item being auctioned, there is a very good chance that the bid will be more (sometimes much more) than the item is worth. So a company that overvalues a good or service, or bids higher than its value has the potential of experiencing this Winner's Curse. In this book, G. Anandalingam and Henry C. Lucas, Jr. expand the model of the Winner's Curse to explain how companies like Tyco, MCI-WorldCom and Bank One overpaid for acquisitions, and how shareholders suffered as a result. They elucidate the disasters that happened during the rush to acquire new technologies and illuminate the reasons that companies that were seemingly pioneers in the dot-com era fell by the wayside. Beginning by exploring the psychological, personal and market factors that can encourage a decision maker to overvalue an asset and experience the Winner's Curse, the book goes on to examine several case studies, including the disastrous wireless spectrum auctions that have devastated the telecommunications industry, and the dot-com bust. It concludes by discussing ways to avoid the Winner's Curse, calling for major changes in the behavior of CEOs and members of boards of directors, as well as the use of powerful techniques for analyzing decisions, including a systems approach to decision making, scenario analysis and game theory. Widespread dieoff of trees associated with severe drought is a recent global phenomenon of increasing conservation and management concern. Tree dieoff is likely to produce dramatic and widespread alterations to plant community composition and successional dynamics, with associated changes in nutrient cycling, hydrology, and wildlife habitat. In order to predict and manage the effects of future widespread drought, there is a need for greater understanding of both the causes of drought-associated tree mortality as well as the subsequent effects of mortality on tree regeneration and understory dynamics. In this study, we investigated the effects of climate, stand structure, and insect herbivores on tree mortality and canopy dieback of semi-arid pinyon-juniper woodlands, as well as the implications of woodland overstory mortality on the abundance of juvenile trees and the distribution of understory plants. In 2015 we resampled 102 plots in a permanent plot network established in 2005 spanning pinyon-juniper woodlands in eleven mountain ranges in central Nevada, encompassing strong gradients of topography, elevation, soil conditions, and aridity. Using individually-tagged trees, we measured tree survival and changes to canopy greenness. In order to assess the effects of neighborhood tree density on changes in tree canopy health, we recorded high-precision GPS locations for each tree and calculated the basal area of neighboring trees and the distance to the nearest neighbor. We measured tree regeneration in two size classes: seedlings (20 cm tall) and sapling (20cm tall). We also measured understory cover by species in 1-m<sup>2</sup> quadrats. We noted the microhabitat of tree juveniles and quadrats in order to assess the importance of fine-scale microhabitat heterogeneity to understory dynamics. This study is the first to document widespread dieoff and canopy decline in Great Basin pinyon-juniper woodlands in response to recent severe drought. We found mortality was most strongly predicted by high growing-season vapor pressure deficit and low winter precipitation (Forest Drought Stress Index), while canopy decline was most closely associated with cumulative climatic water deficit. Trees in sites with deeper soils also experienced greater health declines. Stand structure had a smaller, but significant, effect on tree survival and canopy health, with

trees in dense 4-m neighborhoods and those with close neighbors experiencing increased mortality risk and canopy dieback. As predicted, the regeneration of pinyon pine was strongly influenced by changes to the overstory trees. Both seedlings and saplings were positively associated with plot-level dead tree basal area and with fine-scale mortality-associated microhabitats, suggesting that drought mortality may create canopy gaps with increased recruitment. In contrast to microhabitat results, pinyon seedlings were much more abundant in stands with lower levels of canopy dieback and in stands with more live basal area, suggesting that new recruitment may be limited by reduced seed availability. The dynamics of tree regeneration in woodlands will likely depend upon seed availability, resource levels, timescale, and the abundance and spatial arrangement of larger juveniles (advance regeneration) present before the drought. We found little evidence of response to tree mortality for most understory plant functional types. However, *Poa secunda* and *Bromus tectorum* were both more abundant than expected in mortality-associated microhabitats. At a plot scale, *Bromus tectorum* abundance was positively associated with canopy dieback, and has increased in dominance since 2005 in arid sites with high levels of dieback. While some native species may respond positively to resources released by tree mortality, there is a risk of invasion and increasing dominance of cheatgrass under future droughts, underlining the importance of understanding overstory-understory interactions in arid woodlands. This study highlights the need for further research into the effects of within-stand structural heterogeneity on woodland responses to drought. Pinyon-juniper woodlands have a complex, patchy distribution of trees which likely affects the ways in which competition may predispose trees to drought mortality. Overstory mortality creates heterogeneous microhabitats which alter the distribution of juvenile trees as well as understory species, thus spatially structuring the response of these species to drought. Aridity and severe drought are likely to increase in coming decades, and understanding the complex interactions that drive woodland tree mortality and the subsequent understory response is critical to the effective management of resilient woodlands.

Many senior army officials still claim that if they had been given enough soldiers and weapons, the United States could have won the war in Vietnam. In this probing analysis of U.S. military policy in Vietnam, career army officer and strategist Andrew F. Krepinevich, Jr., argues that precisely because of this mindset the war was lost before it was fought. The army assumed that it could transplant to Indochina the operational methods that had been successful in the European battle theaters of World War II, an approach that proved ill-suited to the way the Vietnamese Communist forces fought. There was a war of insurgency, and counterinsurgency, Krepinevich contends, requires light infantry formations, firepower restraint, and the resolution of political and social problems within the nation. To the very end, top military commanders refused to recognize this. Krepinevich documents the deep division not only between the American military and civilian leaders over the very nature of the war, but also within the U.S. Army itself. Through extensive research in declassified material and interviews with officers and men with battlefield experience, he shows that those engaged in the combat understood early on that they were involved in a different kind of conflict. Their reports and urgings were discounted by the generals, who pressed on with a conventional war that brought devastation but little success. A thorough analysis of the U.S. Army's role in the Vietnam War, *The Army and Vietnam* demonstrates with chilling persuasiveness the ways in which the army was unprepared to fight—lessons applicable to today's wars in Afghanistan and Iraq.
